

Prompting for Legal Documents

The Problem

For long legal documents, oftentimes law practitioners would like to extract entities to answer legal queries. These can be in the format of unstructured free form output, or categorical / multiple choice output.

Current Approach

The current approach is either manually going through each document by hand, which is tedious and time consuming. Recently, some LLMs have come out, but struggle to extract relevant information from legal domain specific documents

How can we make models better?

Model Hallucinations

Ex: What is the age of the defendant?

Model Answer: 73

Human Answer: 28

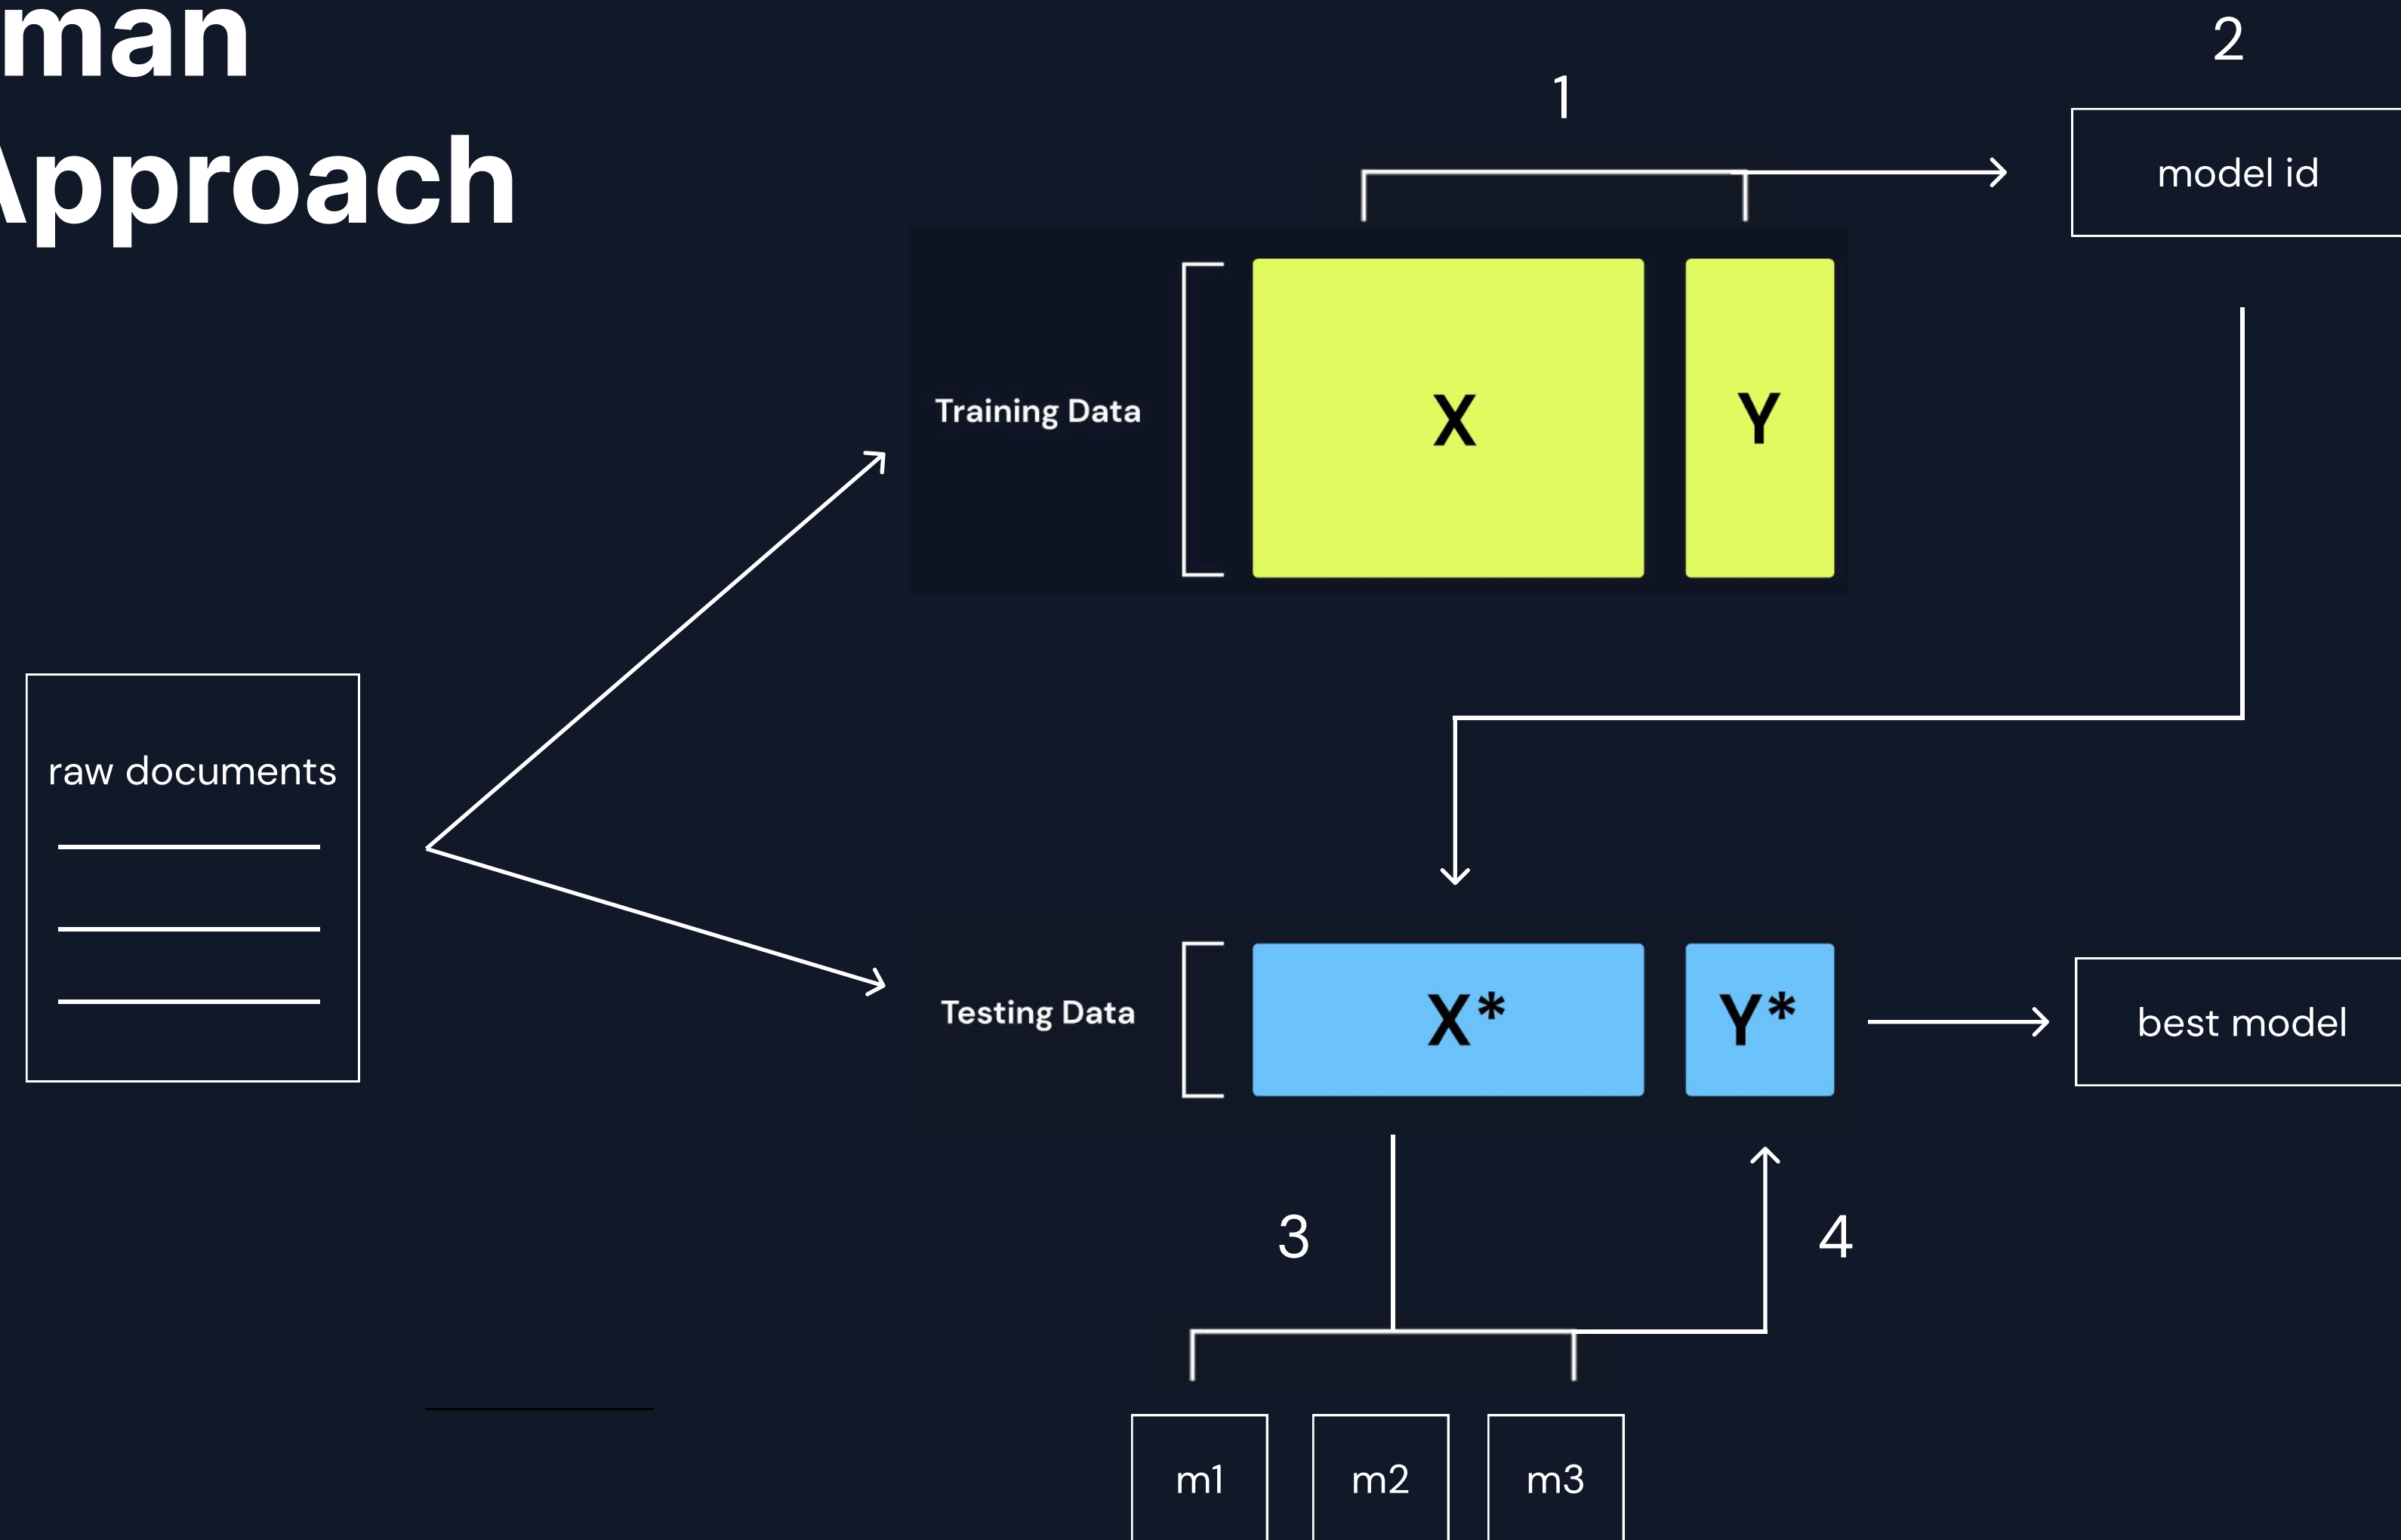

Lack of Domain-Specificity

**Ex: In which jurisdiction did the case
take place?**

Model Answer: I am not sure,

Human Answer: New York, NY.
